LIMIT THEOREMS FOR MARKOV PROCESSES
GENERATED BY ITERATIONS OF RANDOM MAPS

OESOOK LEE

ABSTRACT. We consider the asymptotic behaviors of Markov process which is generated by successive iterations of independent and identically distributed random maps. We show that average contraction of some finite compositions of random maps is sufficient for the existence of a unique invariant measure. A functional central limit theorem and a strong law of large numbers are proved for arbitrary Lipschitzian functions.

1. Introduction

Let $p(x, dy)$ be a transition probability function on $(S, \rho)$, where $S$ is a complete separable metric space. Then a Markov process $X_n$ which has $p(x, dy)$ as its transition probability may be generated by random iterations of the form $X_{n+1} = f(X_n, \mathcal{E}_{n+1})$, where $\mathcal{E}_n$ is a sequence of independent and identically distributed random variables (See, e.g., Kifer(1986), Bhattacharya and Waymire(1990))

In this paper we consider the case $f(x, \epsilon) = f_\epsilon(x)$. We consider a discrete time Markov process $\{X_n\}$ on a complete separable metric space $(S, \rho)$, represented as $X_n = \Gamma_{n}\Gamma_{n-1}\cdots\Gamma_1 X_0$, where $X_0$ is a given random variable with values on $S$ and $\{\Gamma_n\}$ is a sequence of independent and identically distributed random maps on $S$ into itself. Also, $X_0$ and $\{\Gamma_n\}$ are independent. It is assumed that there exist a positive integer $m_0$ and a measurable function $G$ on $\Gamma^{(m_0)}$ such that $\forall \gamma \in \Gamma^{(m_0)}$, $\rho(\gamma x, \gamma y) \leq G(\gamma)\rho(x, y)$ and $E[G(\Gamma_{m_0}\cdots\Gamma_1)] < 1$. $\{X_n\}$ obtained by random affine maps on $\mathbb{R}^n$ can be treated as a special case of this type. It is proved that under an additional assumption, there exists a unique invariant probability $\pi$, where $p^n(x, dy)$ converges weakly to $\pi(dy)$ an $n \to \infty$ for every $x \in S$. It is also shown

Key words: Markov process, invariant probability, weak convergence, strong law of large numbers, functional central limit theorem.
that a functional central limit theorem and a strong law of large numbers hold for Lipschitzian functions. Theorems are proved without mentioning irreducibility or any kind of mixing type conditions. This generalizes an earlier results of Bhattacharya and Lee(1988), in which successive compositions of random maps were assumed to be contractions eventually. The case that \( \Gamma \) has only finitely many maps has been studied by Elton(1987) and Barnsley and Elton(1988). Laskot and Rudnicki(1995) considered the case of \( m_0 = 1 \).

2. Main Results

Let \((S, \rho)\) be a complete separable metric space and \(\mathcal{B}(S)\) its Borel sigma field. Let \(\Gamma\) be a set of continuous maps on \(S\) into itself. Let \(\mathcal{C}\) be the sigma field on \(\Gamma\) such that the map \(\gamma, x \mapsto \gamma(x)\) is a measurable function on \((\Gamma \times S, \mathcal{C} \otimes \mathcal{B}(S))\). Let \(P\) be a probability measure on \((\Gamma, \mathcal{C})\). On some probability space \((\Omega, \mathcal{F}, Q)\) define a sequence of independent and identically distributed random maps \(\Gamma_1, \Gamma_2, \ldots\) with common distribution \(P\) and a random variable \(X_0\) with values in \(S\) independent of the sequence \(\{\Gamma_n\}\). Define \(X_1 = \Gamma_1 X_0, \ldots, X_n = \Gamma_n X_{n-1} = \Gamma_n \cdots \Gamma_1 X_0\). Here, we write \(\gamma x\) for the value of the map \(\gamma \in \Gamma\) at \(x\), and \(\gamma_n \cdots \gamma_1\) for the composition of the maps \(\gamma_1, \ldots, \gamma_n\). Then \(X_n\) is a Markov process with transition probability \(p(x, dy)\) given by

\[
p(x, B) = P(\{\gamma \in \Gamma : \gamma(x) \in B\}), \quad x \in S, B \in \mathcal{B}(S).
\]

\(p^n(x, dy)\) denotes the \(n\)-step transition probability function, i.e. the distribution of \(\Gamma_n \Gamma_{n-1} \cdots \Gamma_1 x\). We shall write \(X_n(x)\) for \(X_n\) with \(X_0 = x\). Note that \(\Gamma_n \cdots \Gamma_1 x\) has the same distribution as \(\Gamma_1 \cdots \Gamma_n x\).

Write \(\Gamma^m\) for the usual Cartesian product \(\Gamma \times \Gamma \times \cdots \times \Gamma\), and let \(P^m\) denote the product probability on \((\Gamma^m, \mathcal{C}^m)\). Let \(\Gamma^m\) be the set of all compositions \(\gamma_m \cdots \gamma_1\) with \(\gamma_i \in \Gamma, 1 \leq i \leq m\). For the sigma field \(\mathcal{C}^m\) on \((\Gamma^m)\), take the class of all sets \(B\) whose inverse under the map \((\gamma_1, \ldots, \gamma_m) \mapsto \gamma_m \cdots \gamma_1\) are in \(\mathcal{C}^m\). Let \(P^m\) be the induced probability measure on \((\Gamma^m, \mathcal{C}^m)\).

We make the following assumptions:

There exist \(x_0 \in S\), a positive integer \(m_0\) and a nonnegative measurable function \(G : \Gamma^{m_0} \rightarrow R\) such that

\[(A1) \quad \forall \gamma \in \Gamma^{m_0}, \rho(\gamma x, \gamma y) \leq G(\gamma) \rho(x, y), \quad \forall x, y \in S\]
(A2) \( \lambda := E[G(\Gamma_{m_0} \cdots \Gamma_1)] < 1 \)
(A3) for each \( r \geq 0, \sup_{x, x_0} \rho(x, x_0) < \infty, \)
\( n = 1, 2, \ldots, m_0. \)

**Theorem 2.1.** Assume for some \( x_0 \), positive integer \( m_0 \) and a nonnegative measurable function \( G \) on \( \Gamma^{(m_0)} \), (A1)-(A3) hold. Then there exists a unique invariant probability \( \pi(dy) \) for \( p(x, dy) \), and \( p^n(x, dy) \) converges weakly to \( \pi(dy) \) for every \( x \in S \).

First let us show a lemma.

**Lemma 2.1.** If the hypotheses of the theorem 2.1 hold, then

\[
\sup \rho(X_n(x), x_0) < \infty
\]

and

\[
\sup_{x, y \in C} \rho(X_n(x), X_n(y)) \to 0
\]

for every compact set \( C \), as \( n \to \infty \).

**Proof.** We define \( H_n(x) := E[\rho(X_n(x), x_0), n = 1, 2, \ldots \) and let \( n \geq 1 \) be such that \( Nm_0 < n \leq (N + 1)m_0 \) for some nonnegative integer \( N \). Then by using the assumption that \( \{\Gamma_n\} \) is independent and identically distributed, we have

\[
H_n(x_0) = E[\rho(\Gamma_1 \cdots \Gamma_n x_0, x_0)]
\]

\[
\leq E[\rho(\Gamma_1 \cdots \Gamma_n x_0, \Gamma_1 \cdots \Gamma_{m_0} x_0) + \rho(\Gamma_1 \cdots \Gamma_{m_0} x_0, x_0)]
\]

\[
\leq E[G(\Gamma_1 \cdots \Gamma_{m_0})] E[\rho(\Gamma_{m_0+1} \cdots \Gamma_n x_0, x_0)] + K
\]

\[
\leq \lambda \left[ \lambda E[\rho(\Gamma_{m_0+1} \cdots \Gamma_n x_0, x_0)] + K \right] + K
\]

\[
\leq (\lambda^n + \lambda^{n-1} + \cdots + 1) K
\]

\[
\leq K(1 - \lambda)^{-1}
\]

for all \( n \), where \( K := \sup_{1 \leq n \leq m_0} H_n(x_0) < \infty \), and hence (2.1) holds.

Fix a compact set \( C \) in \( S \). For every two points \( x, y \in C \)

\[
E[\rho(X_n(x), X_n(y))] = E[\rho(\Gamma_1 \cdots \Gamma_n x, \Gamma_1 \cdots \Gamma_n y)]
\]

\[
\leq \lambda \ E[\rho(\Gamma_{m_0} \cdots \Gamma_1 x, \Gamma_{m_0} \cdots \Gamma_1 y)]
\]

(2.3) \[
\leq \lambda^n \left( H_{n-Nm_0}(x) + H_{n-Nm_0}(y) \right)
\]

\[
\leq 2K_1 \lambda^n,
\]
where \( K_1 := \sup_{1 \leq n \leq m_0} \sup_{x \in C} H_n(x) < \infty \), by the assumption (A3). Letting \( n \to \infty \), i.e. \( N \to \infty \) in (2.3), we have (2.2).

On the set of \( \mathcal{P}(S) \) of all probability measures on \((S, \mathcal{B}(S))\) define the bounded Lipschitzian distance

\[
\| \mu - \nu \|_{BL} := \sup \left\{ \left| \int f \, d\mu - \int f \, d\nu \right| : \| f \|_\infty \leq 1, \| f \|_L \leq 1 \right\} \quad (\mu, \nu \in \mathcal{P}(S)),
\]

where \( \| f \|_\infty = \sup \{|f(x)| : x \in S\}, \| f \|_L = \sup \{|f(x) - f(y)|/\rho(x, y) : x \neq y \in S\}\). It is known that \( \| . \|_{BL} \) metrizes the weak-star topology on \( \mathcal{P}(S) \) (Dudley(1968)).

**Proof of theorem 2.1.** For any \( x_1, x_2 \in C, C \) is a compact set, we have (2.4)

\[
\| p^n(x_1, dy) - p^n(x_2, dy) \|_{BL} = \sup \left\{ \left| E[f(X_n(x_1))] - E[f(X_n(x_2))] \right| : \| f \|_\infty \leq 1, \| f \|_L \leq 1 \right\} \\
\leq E\left[ \rho(X_n(x_1), X_n(x_2)) \wedge 2 \right] \to 0 \quad \text{as} \quad n \to \infty
\]

by (2.2). Now writing \( B(x_0, M) \) for the ball of radius \( M \) centered at \( x_0 \),

\[
\| p^{n+m}(x_0, dy) - p^n(x_0, dy) \|_{BL} \\
\leq E\left[ \rho(\Gamma_1 \cdots \Gamma_n \Gamma_{n+1} \cdots \Gamma_{n+m} x_0, \Gamma_1 \cdots \Gamma_n x_0) \wedge 2 \right] \\
\leq E\left[ \{ \rho(\Gamma_1 \cdots \Gamma_n \Gamma_{n+1} \cdots \Gamma_{n+m} x_0, \Gamma_1 \cdots \Gamma_n x_0) \wedge 2 \} \right] \\
\leq E\left[ \{ \rho(\Gamma_1 \cdots \Gamma_{n+1} \cdots \Gamma_{n+m} x_0, \Gamma_1 \cdots \Gamma_n x_0) \wedge 2 \} \right] \\
\leq E\left[ \{ \rho(\Gamma_1 \cdots \Gamma_{n+1} \cdots \Gamma_{n+m} x_0, x_0) \wedge 2 \} \right] \\
+ E\left[ \{ \rho(\Gamma_1 \cdots \Gamma_n y, \Gamma_1 \cdots \Gamma_n x_0) \wedge 2 \} \right] \\
\leq \sup_{y \in B(x_0, M)} E\left[ \{ \rho(\Gamma_1 \cdots \Gamma_n y, \Gamma_1 \cdots \Gamma_n x_0) \wedge 2 \} \right]
\]

(2.5)

for every \( M > 0 \). By (2.1) and Chebyshev’s inequality, for given \( \epsilon > 0 \), we may choose \( M = M_\epsilon \) such that,

\[
Q\left( \rho(\Gamma_{n+1} \cdots \Gamma_{n+m} x_0, x_0) \geq M_\epsilon \right) < \epsilon / 4, \quad \forall m = 1, 2, \ldots
\]
From (2.2), \( \sup_{y \in B(x_0, M_x)} E \rho (\Gamma_1 \cdots \Gamma_n y, \Gamma_1 \cdots \Gamma_n x_0) \to 0 \) as \( n \to \infty \), which together with (2.5),(2.6) implies for all sufficient large \( n \),

\[
\| p^{n+m}(x_0, dy) - p^n(x_0, dy) \|_{BL} < \epsilon, \quad \forall m = 1, 2, \ldots
\]

Completeness of \( \langle P(S), \| \cdot \|_{BL} \rangle \) ensures the existence of a probability measure \( \pi \) such that

(2.7) \[
\| p^n(x_0, dy) - \pi(dy) \|_{BL} \to 0 \quad \text{as} \quad n \to \infty.
\]

(2.4) and (2.7) imply that \( p^n(x, dy) \to \pi(dy) \) weakly for every \( x \in S \). Since \( \{X_n\} \) is Feller, \( \pi \) is the unique invariant probability.

**Remark.** Suppose (A1)-(A3) are satisfied for \( m_0 = 1 \). Then (A3) holds if \( E \rho (\Gamma_1 x_0, x_0) < \infty \), since \( E \rho (X_1(x), x_0) \leq \lambda \rho (x, x_0) + E \rho (\Gamma_1 x_0, x_0) \).

**Theorem 2.2.** Let the hypotheses of theorem 2.1 hold and let \( \pi \) be the unique invariant probability. Then whatever the initial distribution is,

(2.8) \[
\frac{1}{n} \sum_{i=0}^{n-1} f(X_i) \rightarrow \int f \, d\pi \quad \text{a.e.}, \quad n \to \infty
\]

for any Lipschitz function \( f \) on \( S \).

**Proof.** Let \( f \) be Lipschitzian, i.e. \( |f(x) - f(y)| \leq M \rho (x, y) \) \( \forall x, y \in S \) for some \( M > 0 \). Then \( \int |f| \, d\pi < \infty \), since \( \int \rho (x, x_0) d\pi(x) < \infty \). Let \( \{\tilde{X}_n\} \) be the process with initial invariant distribution \( \pi \), then by Birkhoff’s Ergodic theorem,

\[
\frac{1}{n} \sum_{i=0}^{n-1} f(\tilde{X}_i) \rightarrow \int f \, d\pi \quad \text{a.e.}
\]

Let \( \mu \) be any probability measure on \( S \), and let \( \{X_n : n \geq 0\} \) be the process with initial distribution \( \mu \) and define

\[
X'_0(\omega) = \begin{cases} 
X_0(\omega) & \text{if } \omega \in \Omega_r \\
x_0 & \text{if } \omega \in \Omega - \Omega_r
\end{cases}
\]
where \( \Omega_r = \{ \omega : \rho(X_0(\omega), x_0) \leq r \} \). Let the distribution of \( X'_0 \) be \( \mu' \) and let \( \{X'_n : n \geq 0\} \) be the process with initial distribution \( \mu' \). Now given \( \epsilon > 0 \), set \( A_n = \{ \omega : |f(X'_n) - f(\tilde{X}_n)| > \epsilon \} \). Then by similar manner used in (2.3),

\[
P(A_n) \leq \frac{M}{\epsilon} E\rho(X'_n, \tilde{X}_n)
\]

\[
\leq \frac{M}{\epsilon} \lambda^N E\rho(X'_{n-Nm_0}, \tilde{X}_{n-Nm_0}),
\]

where \( N \) is the integer part of \( \frac{n}{m_0} \). Moreover for \( 0 \leq i \leq m_0 - 1 \),

\[
E\rho(X'_i, \tilde{X}_i) \leq \int E\rho(X_i(x), x_0)\mu'(dx) + \int E\rho(\tilde{X}_i(y), x_0)\pi(dy) \leq K_2
\]

where

\[
K_2 = \sup_{\rho(x, x_0) \leq r} \sup_{0 \leq i \leq m_0 - 1} E\rho(X_i(x), x_0) + \int \rho(y, x_0)\pi(dy) < \infty.
\]

Hence

\[
\sum_{n=0}^{\infty} P(A_n) \leq \frac{M}{\epsilon} \sum_{N=0}^{\infty} \lambda^N \sum_{i=0}^{m_0-1} E\rho(X'_i, \tilde{X}_i)
\]

\[
\leq \frac{M}{\epsilon} m_0 K_2 (1 - \lambda)^{-1} < \infty.
\]

By Borel-Cantelli lemma,

\[
\frac{1}{n} \sum_{i=0}^{n-1} f(X'_i) \longrightarrow \int f \, d\pi \quad \text{a.s.}
\]

But \( \frac{1}{n} \sum_{i=0}^{n-1} f(X'_i) = \frac{1}{n} \sum_{i=0}^{n-1} f(X_i) \) on \( \Omega_r \) and \( P(\Omega_r) \to 1 \) as \( r \to \infty \), which, together with (2.10), completes the proof.

Assume the hypotheses of theorem 2.1 hold and \( \pi \) is the unique invariant probability measure for \( p(x, dy) \). Let \( T \) be the transition operator on \( L^2(S, \pi) \),

\[
Tf(x) := \int f(y) \, p(x, dy), \quad f \in L^2(S, \pi).
\]
Then \((T^n f)(x) = \int f(y) \ p^n(x, dy)\). Let \(I\) denote the identity operator. We denote the \(L^2\)-norm on \(L^2(S, \pi)\) by \(\| \cdot \|_2\). Write \(\tilde{f} = \int f \ d\pi\). Fix \(f \in L^2(S, \pi)\). For each positive integer \(n\), write

\[
Y_n(t) := n^{-\frac{1}{2}} \sum_{i=0}^{\lfloor nt \rfloor} \left( (f(X_i) - \tilde{f}) + (t - \frac{\lfloor nt \rfloor}{n}) (f(X_{\lfloor nt \rfloor + 1}) - \tilde{f}) \right) \quad (t \geq 0),
\]

where \(\lfloor nt \rfloor\) is the integer part of \(nt\).

If, for fixed \(f\), \(Y_n(\cdot)\) converges in distribution to a Brownian motion, then we say that the functional central limit theorem (FCLT) holds for the function \(f\).

**Theorem 2.3.** Under the hypotheses of the theorem 2.1,

1. if the initial distribution of \(X_0\) is \(\pi\), then for every bounded Lipschitzian \(f\), FCLT holds with mean zero and variance parameter 
   \[\| g \|_2^2 - \| T g \|_2^2, \text{ where } (T - I)g = f - \tilde{f}.\]
2. if, in addition, \(\int \rho^2(x, x_0) \ d\pi < \infty\), then for every Lipschitzian, FCLT holds.
3. convergences in (1) and (2) hold regardless of the initial distribution.

**Proof.** Let \(f\) be Lipschitzian on \(S\), \(|f(x) - f(y)| \leq M \rho(x, y), \forall x, y \in S\). Note that

\[
E \rho(X_{nm_0}(x), X_{nm_0}(y)) \leq \lambda^n \rho(x, y).
\]

To prove (1) and (2), it is enough to show that for each case, \(f \in L^2(S, \pi)\) and \(\sum_{n=0}^{\infty} \| T^n (f - \tilde{f}) \|_2 < \infty\) (See Bhattacharya and Lee(1988)).

(1) Assume that for some \(L > 0\), \(|f(x)| \leq L, \forall x \in S\). Then clearly \(f \in L^2(S, \pi)\) and

\[
|T^n (f - \tilde{f})(x)|^2 \leq 2L \left( \int |Ef(X_{nm_0}(x)) - Ef(X_{nm_0}(y))| \pi(dy) \right)
\]
\[
\leq 2LM \int Ef(X_{nm_0}(x), X_{nm_0}(y)) \pi(dy)
\]
\[
\leq 2LM \lambda^n \int \rho(x, y) \pi(dy).
\]

If we let \(a := \int \rho(x, x_0) \ d\pi(x)\), then \(a < \infty\) and

\[
\| T^n (f - \tilde{f}) \|_2^2 \leq 2LM \lambda^n \int \rho(x, y) \pi(dy) \pi(dx)
\]
\[
= (4aLM) \lambda^n.
\]
Since $T$ is a contraction, we get
\[ \| T^{nm_0+k}(f - \bar{f}) \|_2 \leq \| T^{nm_0}(f - \bar{f}) \|_2, \quad k = 0, 1, 2, \ldots, m_0 - 1, \]
and therefore
\[
\sum_{n=0}^{\infty} \| T^n(f - \bar{f}) \|_2 \leq \sum_{n=0}^{\infty} m_0 \| T^{nm_0}(f - \bar{f}) \|_2 \\
\leq \frac{(4aLM)^{1/2}m_0}{(1 - \sqrt{\lambda})} < \infty.
\]

(2) $f \in L^2(S, \pi)$ follows from the assumption $b := \int \rho^2(x, x_0)\pi(dx) < \infty$.
\[
\| T^{nm_0}(f - \bar{f}) \|_2^2 \leq M^2 \int (\int E\rho(X_{nm_0}(x), X_{nm_0}(y))\pi(dy))^2\pi(dx) \\
\leq M^2\lambda^{2n} \int (\int \rho(x, y)\pi(dy))^2\pi(dx) \\
\leq M^2(b + 3a^2)\lambda^{2n}.
\]

Therefore we have
\[
\sum_{n=0}^{\infty} \| T^n(f - \bar{f}) \|_2 \leq M \sqrt{b + 3a^2}m_0(1 - \lambda)^{-1} < \infty.
\]

(3) Let \{X_n\} be the process whose initial distribution is $\mu$, $\mu$ is an arbitrary probability measure on $(S, B(S))$ and let $Y_n(.)$ be the process defined by (2.11). Let $Y'_n(.)$ and $\bar{Y}_n(.)$ be the corresponding processes with \{X_n\} replaced by \{X'_n\} and \{\bar{X}_n\} respectively. Here \{X'_n\} and \{\bar{X}_n\} are defined in the proof of theorem 2.2. Then we have, for fixed Lipschitzian $f$,
\[
E(\max_{0 \leq t \leq 1} |Y'_n(t) - \bar{Y}_n(t)|)
\leq Mn^{-\frac{1}{2}} \sum_{i=0}^{n} E\rho(X'_i, \bar{X}_i) \leq Mn^{-\frac{1}{2}}m_0K_2(1 - \lambda)^{-1},
\]
which goes to 0 as $n \rightarrow \infty$. From the fact that $Y'_n(t) = Y_n(t)$ on $\Omega_r$, and $P(\Omega_r) \rightarrow 1$ as $r \rightarrow \infty$, the conclusion follows.
COROLLARY 2.1. In addition to the assumptions of theorem 2.1, assume $E[G^2(\Gamma_{m_0} \cdots \Gamma_1)] < 1$ and $\sup_{1 \leq n \leq m_0} E[\rho^2(X_n(x_0), x_0)] < \infty$. Then FCLT holds for every Lipschitzian function.

Proof. By theorem 2.3, it remains to show that $\limsup E[\rho^2(X_n(x_0), x_0)] < \infty$, which is obtained by the following inequality:

\[
\left( E[\rho^2(X_n(x_0), x_0)] \right)^{1/2} \\
\leq E[\rho^2(\Gamma_1 \cdots \Gamma_n x_0, \Gamma_1 \cdots \Gamma_{m_0} x_0)]^{1/2} \\
+ \left( E[\rho^2(\Gamma_1 \cdots \Gamma_{m_0} x_0, x_0)] \right)^{1/2} \\
\leq \eta \left( E[\rho^2(\Gamma_{m_0+1} \cdots \Gamma_n x_0, x_0)] \right)^{1/2} + K_3 \\
\leq (\eta^{m_0} + \cdots + \eta + 1) K_3 \leq K_3 (1 - \eta)^{-1},
\]

where $\eta^2 = E[G^2(\Gamma_{m_0} \cdots \Gamma_1)] < 1$, and $K_3^2 = \sup_{1 \leq n \leq m_0} E[\rho^2(X_n(x_0), x_0)] < \infty$.
